## 7-1 Project Submission

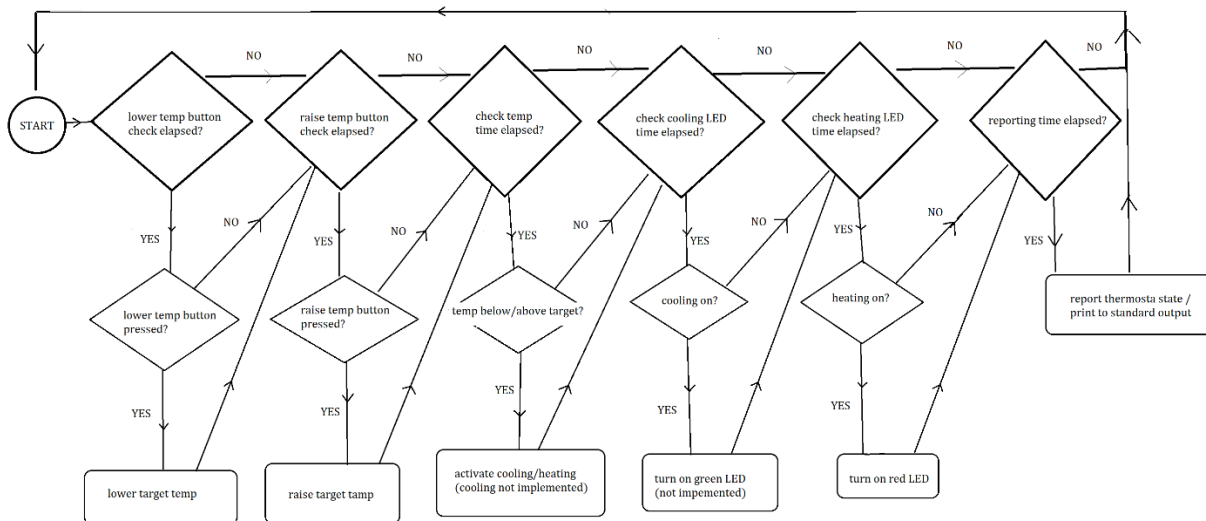

### Task Scheduler and State Machine Documentation

The thermostat task scheduler loops through six tasks and triggers them if a task-specific time period has elapsed. The tasks and their periods (in microseconds) are as follows.

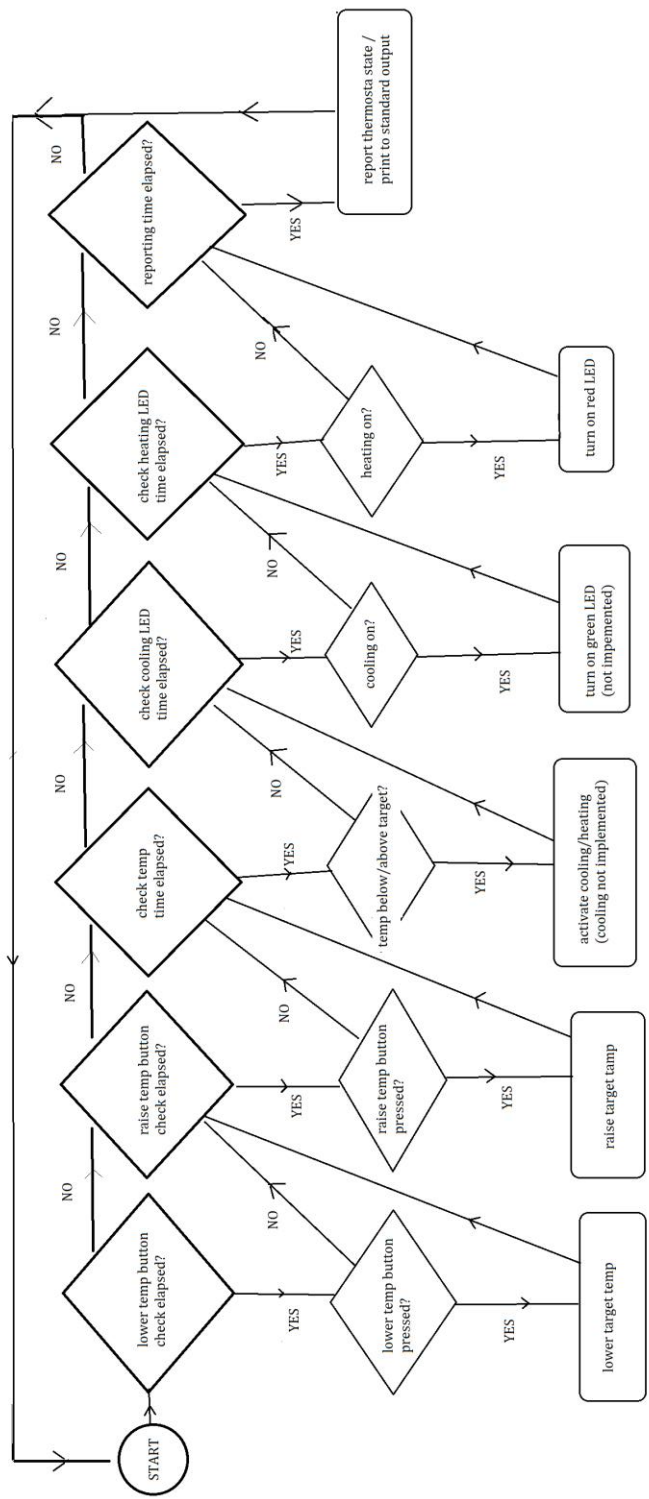

Respond to Lower Temp Button Press	200000 $\mu$ s
Respond to Raise Temp Button Press	200000 $\mu$ s
Respond to Current Temperature	500000 $\mu$ s
Respond to Thermostat Cooling	1000000 $\mu$ s (not implemented)
Respond to Thermostat Heating	1000000 $\mu$ s
Report Thermostat State to Server	1000000 $\mu$ s

All tasks except “Report Thermostat State to Server” rely on a state machine. A diagram of the task scheduler operations is presented below. State machine diagrams are further below.
